Overview

React navigation overview

Changing the app structure for multiple views

Configuring the StackNavigator

Triggering navigation between screens

The StackNavigator

```
import {
  StackNavigator,
} from 'react-navigation';

const App = StackNavigator({
  list: { screen: EventList },
  form: { screen: EventForm },
});
```

Triggering Navigation

```
handleAddEvent = () => {
  this.props.navigation.navigate('form')
}
```

Summary

Install and use React Navigation

Configure navigator in root component

Specify a navigationOptions function to provide options per component

Trigger navigation through navigator passed through on props
